

Multiple Integral

Double Integrals over Rectangles

Remark :

1. Let $P = \{x_0, x_1, \dots, x_n\}$ and $a = x_0 < x_1 < \dots < x_n = b$

Then P is called a partition of $[a, b]$

2. Define $\Delta x_i = x_i - x_{i-1}$, $i = 1, 2, \dots, n$

3. $|P| = \max\{\Delta x_1, \Delta x_2, \dots, \Delta x_n\}$ The norm of P

4. Choose $\bar{x}_i \in [x_{i-1}, x_i]$, $i = 1, 2, \dots, n$, \bar{x}_i is called a sample point. (取樣點)

5. The definite integral of f on $[a, b]$

$$\int_a^b f(x) dx = \lim_{|P| \rightarrow 0} \sum_{i=1}^n f(\bar{x}_i) \Delta x_i = \text{The area of } S$$

$$S = \{(x, y) \mid a \leq x \leq b, 0 \leq y \leq f(x)\}$$

5. The definite integral of f on $[a, b]$

$$\int_a^b f(x)dx = \lim_{|P| \rightarrow 0} \sum_{i=1}^n f(\bar{x}_i) \Delta x_i = \text{The area of } S$$

$$S = \{(x, y) \mid a \leq x \leq b, 0 \leq y \leq f(x)\}$$

6. A closed rectangle R

$$R = [a, b] \times [c, d] = \{(x, y) \in \mathbb{R}^2 \mid a \leq x \leq b, c \leq y \leq d\}$$

Example : Rectangle

1. $[0, 1] \times [2, 4] = \{(x, y) \in \mathbb{R}^2 \mid 0 \leq x \leq 1, 2 \leq y \leq 4\}$

2. $[1, 2] \times [2, 3]$

Double Integrals and Volumes

Let $R = [a, b] \times [c, d]$, $S = \{(x, y, z) \in \mathbb{R}^3 \mid (x, y) \in R, 0 \leq z \leq f(x, y)\}$

To find the volume of S - $V(S)$

Similarly to define $\int_a^b f(x)dx$

Divide the rectangle R into subintervals

$[a, b]$ is divided into m subintervals $[x_{i-1}, x_i]$

$i = 1, 2, \dots, m$, $\Delta x_i = x_i - x_{i-1}$, and $[c, d]$ is divided

into n subintervals $[y_{j-1}, y_j]$, $\Delta y_j = y_j - y_{j-1}$, $j = 1, 2, \dots, n$

Define $R_{ij} = [x_{i-1}, x_i] \times [y_{j-1}, y_j]$ $i = 1, \dots, m$; $j = 1, \dots, n$

The area of R_{ij} is $\Delta A_{ij} = \Delta x_i \Delta y_j$

choose a sample point (x_{ij}^*, y_{ij}^*) in each R_{ij}

The volume of S can be approximated by $\sum_{j=1}^n \sum_{i=1}^m f(x_{ij}^*, y_{ij}^*) \Delta A_{ij}$

i.e. $V(S) \approx \sum_{j=1}^n \sum_{i=1}^m f(x_{ij}^*, y_{ij}^*) \Delta A_{ij}$

Let $|P|$ denote the length of the longest diagonal
 $R_{ij}, i = 1, 2, \dots, m; j = 1, 2, \dots, n$

Definition :

The double integral of f over the rectangle R is $\iint_R f(x, y) dA$

$$\iint_R f(x, y) dA = \lim_{|P| \rightarrow 0} \sum_{i=1}^m \sum_{j=1}^n f(x_{ij}^*, y_{ij}^*) \Delta A_{ij}$$

if this limit exists

properties :

$$1. \iint_{\mathbf{R}} cf(x, y)dA = c \iint_{\mathbf{R}} f(x, y)dA$$

$$2. \iint_{\mathbf{R}} (f(x, y) + g(x, y))dA = \iint_{\mathbf{R}} f(x, y)dA + \iint_{\mathbf{R}} g(x, y)dA$$

3. If $f(x, y) \geq g(x, y) \forall (x, y) \in \mathbf{R}$, then

$$\iint_{\mathbf{R}} f(x, y)dA \geq \iint_{\mathbf{R}} g(x, y)dA$$

Definition :

1. f is integrable on R , if $\lim_{|P| \rightarrow 0} \sum_{i=1}^m \sum_{j=1}^n f(x_{ij}^*, y_{ij}^*) \Delta A_{ij}$ exist

2. $\iint_R f(x, y) dA$ is called the double integral of f over R

Theorem 1

Let f be bounded on the closed rectangle R

- (i) If f is continuous on R , then f is integrable on R
- (ii) If f is continuous on R except on a finite number of smooth curves, then f is integrable on R

Definition :

1. If $\lim_{(x,y) \rightarrow (a,b)} f(x, y) = f(a, b)$, then f is continuous at (a, b)
2. If f is continuous at all $(a, b) \in \mathbb{R}$, then f is continuous on \mathbb{R}

Example :

1. $f(x, y) = \sin xy$, $(x, y) \in \mathbb{R} = [0, \pi] \times [0, 2\pi]$

f is continuous on \mathbb{R}

2. $f(x, y) = x^2y + x$, $\mathbb{R} = [0, \infty) \times [0, \infty)$

f is continuous on \mathbb{R}

3. $f(x, y) = \begin{cases} \frac{y}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

f is not continuous on $(0, 1)$

f is not continuous on $(0, w)$, $\forall w$

Iterated Integrals

Fixed y , Let $A(y) = \int_1^3 x^2 y dx = y \cdot \frac{x^3}{3} \Big|_1^3 = \frac{26}{3} y$

Consider $\int_0^2 A(y) dy = \int_0^2 \left(\int_1^3 x^2 y dx \right) dy$

Remark :

For function $f(x, y)$, $R = [a, b] \times [c, d]$

1. Let $A(x) = \int_c^d f(x, y) dy$, $B(y) = \int_a^b f(x, y) dx$

$\int_a^b A(x) dx = \int_a^b \left(\int_c^d f(x, y) dy \right) dx$ is called an iterated integral

Iterated Integrals

Suppose that f is a function of two variables that is integrable on the rectangle $R = [a, b] \times [c, d]$. We use the notation $\int_c^d f(x, y) dy$ to mean that x is held fixed (and treated as a constant) and $f(x, y)$ is integrated with respect to y from $y = c$ to $y = d$. This procedure is called *partial integration with respect to y* . (Notice its similarity to partial differentiation.) Now $\int_c^d f(x, y) dy$ is a number that depends on the value of x , so it defines a function of x :

$$A(x) = \int_c^d f(x, y) dy$$

Iterated Integrals

If we now integrate the function A with respect to x from $x = a$ to $x = b$, we get

$$\boxed{3} \quad \int_a^b A(x) dx = \int_a^b \left[\int_c^d f(x, y) dy \right] dx$$

The integral on the right side of Equation 7 is called an **iterated integral**. Usually the brackets are omitted. Thus

Iterated Integrals

Similarly, the iterated integral

5

$$\int_c^d \int_a^b f(x, y) dx dy = \int_c^d \left[\int_a^b f(x, y) dx \right] dy$$

Figure 68 $\int_c^d \int_a^b f(x, y) dx dy$

$$2. \int_a^b \int_c^d f(x, y) dy dx = \int_a^b \left(\int_c^d f(x, y) dy \right) dx$$

$$3. \int_c^d \int_a^b f(x, y) dx dy = \int_c^d \left(\int_a^b f(x, y) dx \right) dy$$

Example : evaluate

$$(i) \int_0^3 \int_1^4 x^2 y dx dy \quad (ii) \int_0^3 \int_1^4 x^2 y dy dx$$

$$(iii) \int_0^4 \int_0^8 \frac{1}{4} (64 - 8x + y^2) dy dx$$

$$(iv) \int_0^8 \int_0^4 \frac{1}{4} (64 - 8x + y^2) dx dy$$

$$(v) \int_0^3 \int_1^2 (3x + 2y) dx dy$$

Theorem 2 (Fubini' s Theorem)

If f is continuous on $R = [a, b] \times [c, d]$, the

$$\iint_R f(x, y) dA = \int_c^d \int_a^b f(x, y) dx dy = \int_a^b \int_c^d f(x, y) dy dx$$

Ex :

1. Find $\iint_R (x - 3y^2) dA$, where $R = [0, 2] \times [1, 3]$

2. Find $\iint_R y \sin xy dA$, where $R = [0, 2] \times [0, \pi]$

Ans : $\iint_R y \sin xy dA = \int_0^2 \int_0^\pi y \sin xy dy dx = ?$

$$\begin{aligned} \text{But } \int_0^\pi \int_0^2 y \sin xy dx dy &= \int_0^\pi (-\cos xy) \Big|_0^2 dy = \int_0^\pi (1 - \cos 2y) dy \\ &= \pi - \left(\frac{1}{2} \sin 2y \Big|_0^\pi \right) = \pi - 0 = \pi \end{aligned}$$

3. Find $\iint_R x \cos xy dA$, where $R = [0, \pi] \times [0, \pi]$

4. Find $\iint_R \frac{1+y}{1+x} dA$, where $R = \{(x, y) \mid -1 \leq x \leq 2, 0 \leq y \leq 1\}$

Exercises

1. Let $R = \{(x, y) \mid 1 \leq x \leq 3, 0 \leq y \leq 2\}$, Evaluate

$\iint_R f(x, y) dA$, where f is the given function

$$1. f(x, y) = \begin{cases} 2, & 1 \leq x \leq 3, 0 \leq y \leq 2 \\ 3, & 3 < x \leq 4, 0 \leq y \leq 2 \end{cases}$$

$$2. f(x, y) = \begin{cases} 2, & 1 \leq x \leq 4, 0 \leq y \leq 1 \\ 1, & 1 \leq x < 3, 1 \leq y \leq 2 \\ 4, & 3 \leq x \leq 4, 1 \leq y \leq 2 \end{cases}$$

2. If $R = [0, 1] \times [0, 1]$, show that

$$D \leq \iint_R \sin(x + y) dA \leq 1$$

3. Let $R_1 = \{(x, y) \mid 0 \leq x \leq 2, 0 \leq y \leq 1\}$, $R = [0, 2] \times [0, 2]$

$$R_2 = \{(x, y) \mid 0 \leq x \leq 2, 1 \leq y \leq 2\}$$

Suppose that $\iint_R f(x, y) dA = 4$, $\iint_R g(x, y) dA = 6$, $\iint_{R_2} g(x, y) dA = 2$

Evaluate

1. $\iint_R (4f(x, y) - g(x, y)) dA$

2. $\iint_{R_1} 3g(x, y) dA$

3. $\iint_R (2f(x, y) + 4) dA$

4. $\iint_R (3f(x, y) + 4g(x, y)) dA$

4. Evaluate each of the iterated integrals

(i) $\int_0^2 \int_1^3 f(x, y) dy dx$, where $f(x, y) = x^2 y$

(ii) $\int_0^1 \int_0^1 x e^{xy} dx dy$

(iii) $\int_0^\pi \int_0^1 x \sin y dx dy$

(iv) $\int_0^2 \int_0^2 \frac{y}{1+x^2} dy dx$

(v) $\int_{-2}^2 \int_{-1}^1 |x^2 y^3| dy dx$

(vi) $\int_{-2}^2 \int_{-1}^1 [x^2] y^3 dy dx$

(vii) $\int_{-2}^2 \int_{-1}^1 [x] |y| dy dx$

5. Calculate the double integral

$$(i) \iint_R (2y^2 - 3xy^3) dA, R = \{(x, y) \mid 1 \leq x \leq 2, 0 \leq y \leq 3\}$$

$$(ii) \iint_R x \cos(x + y) dA, R = [0, \frac{\pi}{6}] \times [0, \frac{\pi}{3}]$$

$$(iii) \iint_R \frac{1+x}{2+y} dA, R = \{(x, y) \mid -1 \leq x \leq 2, 0 \leq y \leq 1\}$$

$$(iv) \iint_R xye^{x^2y^2} dA, R = [0, 1] \times [0, 1]$$

$$(v) \iint_R xy \sqrt{1+x^2} dA, R = \{(x, y) \mid 0 \leq x \leq \sqrt{3}, 1 \leq y \leq 2\}$$

6. Find the volume of the solid lying under the plane $Z = 2x + 5y + 1$ and above the rectangle $\{(x, y) \mid (-1 \leq x \leq 0, 1 \leq y \leq 4)\}$

7. Evaluate the iterated integral

(i) $\int_0^1 \int_0^x \cos x^2 dy dx$

(ii) $\int_0^1 \int_{1-x}^{2+x} (3x - y^2) dy dx$

(iii) $\int_0^1 \int_{3y}^3 e^{x^2} dx dy$

(iv) $\int_0^1 \int_{\sqrt{y}}^1 \sqrt{1+x^3} dx dy$

(v) $\int_0^1 \int_0^{y^2} 2ye^x dx dy$

(vi) $\int_0^4 \int_{x/2}^3 e^{y^2} dy dx$

8. Evaluate $\iint_D \sqrt{1 - x^2 - y^2} \, dA$, where $D = \{(x, y) \mid x^2 + y^2 \leq 1\}$

9. Find the volume of the given solid

(i) Bounded by the cylinders $x^2 + y^2 = 2^2$ and

$$y^2 + z^2 = 2^2$$

(ii) Bounded by the planes $x = 0$, $y = 0$, $z = 0$

and $x + y + z = 1$

Double Integral over General Regions

Let D be a bounded region and $D \subset R$, f is a function defined on D . Define a new function

$$F(x, y) = \begin{cases} f(x, y) & \text{if } (x, y) \in D \\ 0 & \text{if } (x, y) \text{ is in } R \text{ but not in } D \end{cases}$$

Definition :

1. The double integral of f over D is

$$\iint_D f(x, y) dA = \iint_R F(x, y) dA$$

2. A plane region D is said to be of type I if

$$D = \{(x, y) \mid a \leq x \leq b, g_1(x) \leq y \leq g_2(x)\},$$

where g_1, g_2 are two continuous function.

3. A plane region D is said to be of type II if

$$D = \{(x, y) \mid h_1(y) \leq x \leq h_2(y), c \leq y \leq d\},$$

where h_1, h_2 are two continuous function.

Example :

1. $D_1 = \{(x, y) \mid 0 \leq x \leq \pi, \sin x \leq y \leq 1\}$, Type I

2. $D_2 = \{(x, y) \mid -1 \leq y \leq 1, 2y^2 \leq x \leq 1 + y^2\}$, Type II

Properties :

1. If f is continuous on a type I region D such that

$$D = \{(x, y) \mid a \leq x \leq b, g_1(x) \leq y \leq g_2(x)\},$$

$$\text{then } \iint_D f(x, y) dA = \int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y) dy dx$$

2. If f is continuous on a type II region D then

$$\iint_D f(x, y) dA = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y) dx dy$$

$$\text{where } D = \{(x, y) \mid h_1(y) \leq x \leq h_2(y), c \leq y \leq d\}$$

Example :

1. Evaluate $\iint_D (x + 3y) dA$

Where $D = \{(x, y) \mid -1 \leq x \leq 1, 2x^2 \leq y \leq 1 + x^2\}$

Ans :

$$\begin{aligned} \iint_D (x + 3y) dA &= \int_{-1}^1 \int_{2x^2}^{1+x^2} (x + 3y) dy dx \\ &= \int_{-1}^1 x(1 + x^2 - 2x^2) + \frac{3}{2} ((1 + x^2)^2 - (2x^2)^2) dx \\ &= \int_{-1}^1 x + x^3 - 2x^3 + \frac{3}{2} + 3x^2 + \frac{3}{2} x^4 - 4x^4 dx \\ &= \left(\frac{1}{2} x^2 - \frac{1}{4} x^4 + \frac{3}{2} x + x^3 - \frac{1}{2} x^5 \right) \Big|_{-1}^1 = \frac{3}{2} + 1 - \frac{1}{2} = 2 \end{aligned}$$

2. Evaluate $\iint_D xy dA$ where D is the region bounded by

the line $y = x - 1$ and the parabola $y^2 = 2x + 6$

Sol:

$$D = \{(x, y) \mid -3 \leq x \leq 5, -2 \leq y \leq \sqrt{2x + 6}\}$$

$$= \{(x, y) \mid \frac{y^2 - 6}{2} \leq x \leq y + 1, -2 \leq y \leq 4\}$$

$$\iint_D xy dA = \int_{-2}^4 \int_{\frac{y^2 - 6}{2}}^{y+1} xy dx dy = 36$$

3. Find the volume of the tetrahedron bounded by the planes $x = 2y$, $x = 0$, $z = 0$ and $x + 2y + z = 2$

Sol:

$$D = \{(x, y) \mid 0 \leq x \leq 1, \frac{x}{2} \leq y \leq \frac{2-x}{2}\}$$

$$\begin{aligned} \text{所求 } V &= \iint_D (2-x-2y) dA = \int_0^1 \int_{\frac{x}{2}}^{\frac{2-x}{2}} (2-x-2y) dy dx \\ &= \frac{1}{3} \end{aligned}$$

4. Evaluate $\int_0^1 \int_x^1 \sin(y^2) dy dx$; $\frac{1}{2}(1 - \cos 1)$

5. Evaluate $\int_0^1 \int_x^1 \cos(y^2) dy dx$

Sol:

$$\begin{aligned} D &= \{(x, y) \mid 0 \leq x \leq 1, x \leq y \leq 1\} \\ &= \{(x, y) \mid 0 \leq y \leq 1, 0 \leq x \leq y\} \end{aligned}$$

Double Integrals in Polar Coordinates

Consider $R = \{(r, \theta) \mid a \leq r \leq b, \alpha \leq \theta \leq \beta\}$

Polar rectangle

Example :

$$1. R = \{(r, \theta) \mid 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi\}$$

$$2. R = \{(r, \theta) \mid 1 \leq r \leq 3, 0 \leq \theta \leq \pi\}$$

$$3. R = \{(r, \theta) \mid 1 \leq r \leq 3, \frac{\pi}{3} \leq \theta \leq \frac{\pi}{2}\}$$

$$\text{The area of } R \text{ is } A(R) = (\pi \cdot 3^2 - \pi \cdot 1^2) \frac{\frac{\pi}{2} - \frac{\pi}{3}}{2\pi}$$

$$= \frac{1}{2} (3^2 - 1^2) \cdot \left(\frac{\pi}{2} - \frac{\pi}{3}\right)$$

$$= \frac{2}{3} \pi$$

$$4. R_{ij} = \{(r, \theta) \mid r_{i-1} \leq r \leq r_i, \theta_{j-1} \leq \theta \leq \theta_j\}$$

The area of $R_{ij} - \Delta A_{ij}$ is

$$\begin{aligned} \Delta A_{ij} &= \frac{1}{2} r_i^2 \Delta \theta_j - \frac{1}{2} r_{i-1}^2 \Delta \theta_j = \frac{1}{2} (r_i + r_{i-1})(r_i - r_{i-1}) \Delta \theta_j \\ &= r_i^* \Delta r_i \Delta \theta_j \end{aligned}$$

Where $\Delta r_i = r_i - r_{i-1}$, $\Delta \theta_j = \theta_j - \theta_{j-1}$, $i = 1, \dots, m$; $j = 1, \dots, n$

The Riemann sum of f on R is

$$\begin{aligned} &\sum_{i=1}^m \sum_{j=1}^n f(r_i^* \cos \theta_j^*, r_i^* \sin \theta_j^*) \Delta A_{ij} \\ &= \sum_{i=1}^m \sum_{j=1}^n f(r_i^* \cos \theta_j^*, r_i^* \sin \theta_j^*) r_i^* \Delta r_i \Delta \theta_j \\ &\rightarrow \int_{\alpha}^{\beta} \int_a^b f(r \cos \theta, r \sin \theta) r dr d\theta \end{aligned}$$

Properties

1. Let $R = \{(r, \theta) \mid a \leq r \leq b, \alpha \leq \theta \leq \beta\}$ be a polar rectangle and $0 \leq \beta - \alpha \leq 2\pi$. If f is continuous on R , then

$$\iint_R f(x, y) dA = \int_{\alpha}^{\beta} \int_a^b f(r \cos \theta, r \sin \theta) r dr d\theta$$

2. Let $D = \{(r, \theta) \mid \alpha \leq \theta \leq \beta, h_1(\theta) \leq r \leq h_2(\theta)\}$ be a polar region. If f is continuous on D then

$$\iint_D f(x, y) dA = \int_{\alpha}^{\beta} \int_{h_1(\theta)}^{h_2(\theta)} f(r \cos \theta, r \sin \theta) r dr d\theta$$

Example :

1. Evaluate $\iint_{\mathbf{R}} (4y^2 + 3x) dA$

where $\mathbf{R} = \{(x, y) \mid y \geq 0, 1 \leq x^2 + y^2 \leq 4\}$

Sol :

$$\begin{aligned}\mathbf{R} &= \{(x, y) \mid y \geq 0, 1 \leq x^2 + y^2 \leq 4\} \\ &= \{(r, \theta) \mid 1 \leq r \leq 2, 0 \leq \theta \leq \pi\}\end{aligned}$$

$$\begin{aligned}\iint_{\mathbf{R}} (4y^2 + 3x) dA &= \int_0^{\pi} \int_1^2 (4(r \sin \theta)^2 + 3r \cos \theta) r dr d\theta \\ &= \int_0^{\pi} (15 \sin^2 \theta + 7 \cos \theta) d\theta \\ &= \frac{15}{2} \pi\end{aligned}$$

2. Find the volume of the solid bounded by the plane $z = 0$
and the paraboloid $z = 1 - x^2 - y^2$

Sol:

$$D = \{(r, \theta) \mid 0 \leq r \leq 1, 0 \leq \theta \leq 2\pi\}$$

$$V = \iint_D (1 - x^2 - y^2) dA$$

$$= \int_0^{2\pi} \int_0^1 (1 - r^2) r dr d\theta$$

$$= \frac{\pi}{2}$$

Example :

$$\text{Evaluate } \iint_{\mathbb{R}^2} e^{-(x^2+y^2)} dA$$

$$\text{where } \mathbb{R}^2 = \{(x, y) \mid -\infty < x < \infty, -\infty < y < \infty\}$$

Sol:

$$\text{Consider } D_n = \{(r, \theta) \mid 0 \leq r \leq n, 0 \leq \theta \leq 2\pi\}$$

$$\iint_{\mathbb{R}^2} e^{-(x^2+y^2)} dA = \lim_{n \rightarrow \infty} \iint_{D_n} e^{-(x^2+y^2)} dA$$

$$= \lim_{n \rightarrow \infty} \int_0^{2\pi} \int_0^n e^{-r^2} r dr d\theta = \lim_{n \rightarrow \infty} \int_0^{2\pi} \left(\frac{1}{2} - \frac{1}{2} e^{-n^2} \right) d\theta$$

$$= \pi$$

The Cross Product

Definition

Let $\underline{a}, \underline{b}$ be two nonzero three dimensional vectors

1. The inner product of \underline{a} and \underline{b} is $\underline{a} \cdot \underline{b} = |\underline{a}| |\underline{b}| \cos \theta$

2. The cross product of \underline{a} and \underline{b} is the vector $\underline{a} \times \underline{b} = (|\underline{a}| |\underline{b}| \sin \theta) \underline{n}$

where θ is the angle between \underline{a} and \underline{b} , $0 \leq \theta \leq \pi$, and \underline{n} is a unit vector perpendicular to both \underline{a} and \underline{b} and whose direction is given by the right - hand rule : If the fingers of your right hand curl through the angle θ from \underline{a} to \underline{b} , then your thumb points in the direction of \underline{n}

Example :

Properties

1. \underline{a} and \underline{b} are parallel if and only if $\underline{a} \times \underline{b} = \underline{0}$

2. $\underline{i} = (1,0,0)$, $\underline{j} = (0,1,0)$, $\underline{k} = (0,0,1)$

(i) $\underline{i} \times \underline{j} = \underline{k}$, $\underline{j} \times \underline{i} = -\underline{k}$

(ii) $\underline{j} \times \underline{k} = \underline{i}$, $\underline{k} \times \underline{j} = -\underline{i}$

(iii) $\underline{k} \times \underline{i} = \underline{j}$, $\underline{i} \times \underline{k} = -\underline{j}$

3. $\underline{a} \times \underline{b} = -\underline{b} \times \underline{a}$

4. Let c be a scalar

$$(i) \quad (c\underline{a}) \times \underline{b} = c(\underline{a} \times \underline{b}) = \underline{a} \times (c\underline{b})$$

$$(ii) \quad \underline{a} \times (\underline{b} + \underline{D}) = \underline{a} \times \underline{b} + \underline{a} \times \underline{D}$$

$$(iii) \quad (\underline{a} + \underline{b}) \times \underline{D} = \underline{a} \times \underline{D} + \underline{b} \times \underline{D}$$

5. If $\underline{a} = (a_1, a_2, a_3)$, $\underline{b} = (b_1, b_2, b_3)$, then

$$\underline{a} \times \underline{b} = (a_2 b_3 - a_3 b_2, a_3 b_1 - a_1 b_3, a_1 b_2 - a_2 b_1)$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} = \begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} a_1 & a_3 \\ b_1 & b_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} \mathbf{k}$$

The area of R is

$$A(R) = |\underline{a} \times \underline{b}|$$

Example

1. $\underline{a} = (1, 2, 0)$, $\underline{b} = (2, -1, 3)$

$$\underline{a} \times \underline{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & 0 \\ 2 & -1 & 3 \end{vmatrix} = 6\mathbf{i} - 3\mathbf{j} - 5\mathbf{k}$$

$$\underline{b} \times \underline{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 3 \\ 1 & 2 & 0 \end{vmatrix} = -6\mathbf{i} + 3\mathbf{j} + 5\mathbf{k}$$

2. $\underline{a} = (1, 3, 4)$, $\underline{b} = (2, 7, -5)$

$$\underline{a} \times \underline{b} = -43\mathbf{i} + 13\mathbf{j} + \mathbf{k}$$

3. $\underline{a} = \mathbf{i} + \mathbf{j} + \mathbf{k}$, $\underline{b} = \mathbf{i} + \mathbf{j} - \mathbf{k}$, Find $\underline{a} \times \underline{b}$

4. Find two unit vectors orthogonal to both $\mathbf{i} + \mathbf{j}$ and $\mathbf{i} - \mathbf{j} + \mathbf{k}$

Surface Area

Definition :

1. parametric curve : $\begin{cases} x = x(t) \\ y = y(t) \end{cases}, \alpha \leq t \leq \beta$

2. The set of all points $(x, y, z) \in \mathbb{R}^3$

such that $\begin{cases} x = x(u, v) \\ y = y(u, v), (u, v) \in D \subset \mathbb{R}^2 \\ z = z(u, v) \end{cases}$

is called a parametric surface S

Example :

$$1. S = \{(x, y, z) \mid x = 2\cos u, y = v, z = 2\sin u\}$$

S is a parametric surface

For any $(x, y, z) \in S$, we have $x^2 + z^2 = 4$, $y = v$, $v \in \mathbb{R}$

Definition :

3. A plane in space is determined by a point $r_0 = P_0(x_0, y_0, z_0)$ in the plane and a vector \underline{n} is orthogonal to the plane.

This orthogonal vector \underline{n} is called a normal vector

4. The plane is denoted by $\underline{n} \cdot (r - r_0) = 0$ where $r = (x, y, z)$
 \underline{n} is a normal vector of the plane

A vector equation of the plane $\underline{n} \cdot (r - r_0) = 0$

Example :

$$1. S = \{(x, y, z) \mid (1, 2, 4) \cdot (x - 3, y + 1, z - 4) = 0\}$$

$$2. S = \{(x, y, z) \mid 2x - 4y + z = 0\}, \underline{n} = (2, -4, 1)$$

$$3. S = \{(x, y, z) \mid x + 2y + 3z = 6\}, \underline{n} = (1, 2, 3)$$

Example :

Find an equation of the plane that passes through the points

$$P(1, 3, 2), Q(3, -1, 6), R(5, 2, 0)$$

$$\text{Sol: } 12(x - 1) + 20(y - 3) + 14(z - 2) = 0$$

Definition :

5. Two plane are parallel if their normal vectors are parallel

6. The angle between the planes S_1 and S_2 is θ if their normal vectors have the angle θ

Example :

Find the angle between the plane $x + y + z = 1$ and $x - 2y + 3z = 2$

Sol:

The normal vectors of these planes are $\underline{n}_1 = (1,1,1)$, $\underline{n}_2 = (1,-2,3)$

Let θ be the angle between the planes

$$\cos \theta = \frac{\underline{n}_1 \cdot \underline{n}_2}{|\underline{n}_1| |\underline{n}_2|} = \frac{2}{\sqrt{42}}, \theta = \cos^{-1}\left(\frac{2}{\sqrt{42}}\right) \approx 72^\circ$$

Example :

$$z = f(x, y) = x^2 y, \quad \frac{\partial f(x, 1)}{\partial x} = 2x, \quad \frac{\partial f(3, y)}{\partial y} = 9$$

$L_i, i = 1, 2$, is the tangent line of C_i

Definition :

Let S be a parametric surface and be defined by

$$S = \{(x, y, z) \mid z = z(u, v), y = y(u, v), x = x(u, v)\}$$

$$r(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k} \quad \text{Fixed } (u_0, v_0)$$

(i) $r(u_0, v)$ is a vector function of the single parameter v and defines a grid curve c_1 lying on S

(ii) $r(u, v_0)$ is a vector function of the single parameter u and defines a grid curve c_2 lying on S

(iii) The tangent vector to c_1 at $P_0 - (x_0, y_0, z_0)$ where $x_0 = x(u_0, v_0)$, $y_0 = y(u_0, v_0)$, $z_0 = z(u_0, v_0)$ is obtained

$$r_v = \frac{\partial x(u_0, v_0)}{\partial v} \mathbf{i} + \frac{\partial y(u_0, v_0)}{\partial v} \mathbf{j} + \frac{\partial z(u_0, v_0)}{\partial v} \mathbf{k}$$

(iv) Similarly to c_2 The tangent vector is

$$r_u = \frac{\partial x(u_0, v_0)}{\partial u} \mathbf{i} + \frac{\partial y(u_0, v_0)}{\partial u} \mathbf{j} + \frac{\partial z(u_0, v_0)}{\partial u} \mathbf{k}$$

(v) The surface S is called smooth if $r_u \times r_v \neq \underline{0}$

Exercises 2

1. Find the cross product $\underline{a} \times \underline{b}$, $\underline{b} \times \underline{a}$

(i) $\underline{a} = (-2, 3, 4)$, $\underline{b} = (3, 0, 1)$

(ii) $\underline{a} = (1, 2, -3)$, $\underline{b} = (5, -2, -1)$

(iii) $\underline{a} = (1, 2, 0)$, $\underline{b} = (0, 2, 4)$

2. Find $|\underline{u} \times \underline{v}|$ and determine whether $\underline{v} \times \underline{u}$ is directed into the page or out of the page

3. Consider the function

$$f(x, y) = \begin{cases} \frac{x^2 y}{x^4 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 0 & , \text{if } (x, y) = (0, 0) \end{cases}$$

Is f continuous at $(0, 0)$? why or why not?

4. Consider the function

$$f(x, y) = \begin{cases} \frac{xy}{x^2 + y^2}, & \text{if } (x, y) \neq (0, 0) \\ 1 & , \text{if } (x, y) = (0, 0) \end{cases}$$

(i) show that $f(x, y)$ is not continuous at $(0, 0)$

(ii) Find $\lim_{(x, y) \rightarrow (0, 0)} f(x, y)$

5. Evaluate $\iint_D xy \, dA$, where D is the region in the following

6. Evaluate $\iint_D \sin(xy^2) \, dA$, where $D = \{(x, y) \mid 1 \leq x^2 + y^2 \leq 4\}$

7. Evaluate $\iint_D x^2 dA$, where D is the region between the ellipse

$$x^2 + 2y^2 = 4 \text{ and the circle } x^2 + y^2 = 4$$

8. Evaluate $\iint_D xy^2 dA$

9. Evaluate the iterated integrals

(i) $\int_0^{\pi/2} \int_0^{\cos\theta} r^2 \sin\theta dr d\theta$

(ii) $\int_0^\pi \int_0^{1-\cos\theta} r \sin\theta dr d\theta$

(iii) $\int_0^\pi \int_0^{\sin\theta} r^2 dr d\theta$

(iv) $\int_0^\pi \int_0^{\sin y} x^2 dx dy$

10. Evaluate $\iint_D e^{x^2+y^2} dA$, where D is the region enclosed by

$$x^2 + y^2 = 4$$

11. Evaluate

(i) $\int_0^1 \int_0^{\sqrt{1-y^2}} \sin(x^2 + y^2) dx dy$

(ii) $\int_1^2 \int_0^{\sqrt{2x-x^2}} (x^2 + y^2)^{-\frac{1}{2}} dy dx$

(iii) $\iint_D \sin \sqrt{x^2 + y^2}, \iint_D |\sin \sqrt{x^2 + y^2}| dA$, where

$$D = \{(x, y) \mid x^2 + y^2 \leq 4\pi^2\}$$

12. Switch to rectangular coordinates and then evaluate

$$\int_{3\pi/4}^{4\pi/3} \int_0^{-5\sec\theta} r^3 \sin^2 \theta dr d\theta$$

13. Find the area of the surface $z = x^2 + y^2$ below the plane $z = 9$
14. Find the area of the surface $x = uv, y = u + v, z = u - v, u^2 + v^2 \leq 1$
15. Find the area of the surface obtained by rotating the given curve about the x -axis

(i) $y = x^3, 0 \leq x \leq 2$

(ii) $y = \sqrt{x}, 4 \leq x \leq 9$

16. Evaluate the iterated integral

(i) $\int_0^1 \int_0^z \int_0^y xyz dx dy dz$ (ii) $\int_0^\pi \int_0^2 \int_0^{\sqrt{4-z^2}} z \sin y dx dz dy$

(iii) $\int_0^3 \int_0^{\sqrt{9-x^2}} \int_0^x yz dy dz dx$ (iv) $\int_0^1 \int_x^{2x} \int_0^{x+y} 2xy dz dy dx$

Definition

1. Let S be a smooth parametric surface and is given by the equation

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}, \quad (u, v) \in D$$

and S is covered just once as (u, v) ranges throughout the parameter

domain D , then the surface area of S is $A(S) = \iint_D |\mathbf{r}_u \times \mathbf{r}_v| \, dA$

$$\text{where } \mathbf{r}_u = \frac{\partial x}{\partial u} \mathbf{i} + \frac{\partial y}{\partial u} \mathbf{j} + \frac{\partial z}{\partial u} \mathbf{k} \quad \mathbf{r}_v = \frac{\partial x}{\partial v} \mathbf{i} + \frac{\partial y}{\partial v} \mathbf{j} + \frac{\partial z}{\partial v} \mathbf{k}$$

Example :

1. Spherical coordinate (ρ, θ, ϕ)

$$p(x, y, z)$$

$$p(\rho, \theta, \phi)$$

$$\text{where } \rho = |\overline{op}| = \sqrt{x^2 + y^2 + z^2}$$

$$x = \rho \sin \phi \cos \theta$$

$$y = \rho \sin \phi \sin \theta \quad \rho \geq 0, 0 \leq \phi \leq \pi$$

$$z = \rho \cos \phi$$

2. Find the rectangular coordinates Spherical coordinate

$$\left(1, \frac{\pi}{4}, \frac{\pi}{3}\right) \quad x = 1 \cdot \sin \frac{\pi}{3} \cos \frac{\pi}{4} = \frac{\sqrt{6}}{4}$$

$$y = 1 \cdot \sin \frac{\pi}{3} \sin \frac{\pi}{4} = \frac{\sqrt{6}}{4}$$

$$z = 1 \cdot \cos \frac{\pi}{3} = \frac{1}{2}$$

3. Change from rectangular to spherical coordinates

(i) $(1, 1, \sqrt{2})$ (ii) $(\sqrt{3}, 0, 1)$ (iii) $(0, 2\sqrt{3}, -2)$

Sol:

$$(i) \quad \rho = \sqrt{x^2 + y^2 + z^2} = \sqrt{1^2 + 1^2 + (\sqrt{2})^2} = 2$$

$$z = \rho \cos \phi \Rightarrow \sqrt{2} = 2 \cos \phi, \quad \phi = \frac{\pi}{4}$$

$$x = \rho \sin \phi \cos \theta \Rightarrow 1 = 2 \sin \frac{\pi}{4} \cos \theta, \quad \theta = \frac{\pi}{4}$$

4. parametric surface S

$$(i) S = \left\{ \begin{array}{l} (x, y, z) \mid x = 4\sin\phi\cos\theta, y = 4\sin\phi\sin\theta, z = 4\cos\phi \\ 0 \leq \phi \leq \pi, \quad 0 \leq \theta \leq 2\pi \end{array} \right\}$$

S - The surface of a spherical of radius 4

(ii) Find the surface area of S

Sol: The parametric equation is

$$r(\theta, \phi) = 4\sin\phi\cos\theta \cdot i + 4\sin\phi\sin\theta \cdot j + 4\cos\phi \cdot k$$

$$\text{and } (\theta, \phi) \in D = \{(\theta, \phi) \mid 0 \leq \theta \leq 2\pi, 0 \leq \phi \leq \pi\}$$

$$\text{caculate } r_{\theta} = -4\sin\phi\sin\theta \cdot i + 4\sin\phi\cos\theta \cdot j + 0 \cdot k$$

$$r_{\phi} = 4\cos\phi\cos\theta \cdot i + 4\cos\phi\sin\theta \cdot j + 4(-\sin\phi) \cdot k$$

$$r_{\theta} \times r_{\phi} = \begin{vmatrix} i & j & k \\ -4\sin\phi\sin\theta & 4\sin\phi\cos\theta & 0 \\ 4\cos\phi\cos\theta & 4\cos\phi\sin\theta & -4\sin\phi \end{vmatrix}$$

$$= -16\sin^2\phi\cos\theta i - 16\sin^2\phi\sin\theta j + 16\cos\phi\sin\phi k$$

Thus

$$\begin{aligned} |\mathbf{r}_\theta \times \mathbf{r}_\phi| &= \sqrt{(-16\sin^2\phi\cos\theta)^2 + (-16\sin^2\phi\sin\theta)^2 + (16\cos\phi\sin\phi)^2} \\ &= 16\sin\phi \end{aligned}$$

$$A(S) = \iint_D |\mathbf{r}_\theta \times \mathbf{r}_\phi| \, dA = \int_0^\pi \int_0^{2\pi} 16\sin\phi \, d\theta \, d\phi = 4\pi \cdot 16$$

Remark

$$1. A(S) = \iint_D |\mathbf{r}_u \times \mathbf{r}_v| \, dA$$

The area of S_{ij}

$$A(S_{ij}) \approx |\Delta \mathbf{u} \cdot \mathbf{r}_u \times \Delta \mathbf{v} \cdot \mathbf{r}_v| = |\mathbf{r}_u \times \mathbf{r}_v| \Delta u \Delta v$$

$$A(S) = \sum A(S_{ij}) \approx \sum (\mathbf{r}_u \times \mathbf{r}_v) \cdot \Delta \mathbf{u} \Delta \mathbf{v} \\ \rightarrow \iint_D |\mathbf{r}_u \times \mathbf{r}_v| dA$$

$$2. S = \{(x, y, z) \mid z = f(x, y), (x, y) \in D\}$$

The surface area of S is

$$A(S) = \iint_D \sqrt{1 + \left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2} dA$$

$$(\because \mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + f(x, y)\mathbf{k})$$

Triple Integrals

Rectangular box :

$$\begin{aligned} B &= \{(x, y, z) \mid a \leq x \leq b, c \leq y \leq d, e \leq z \leq f\} \\ &= [a, b] \times [c, d] \times [e, f] \end{aligned}$$

Example :

$$1. B = [0, 1] \times [1, 3] \times [0, 2]$$

Definition :

Let $B = [a, b] \times [c, d] \times [e, f]$ be a rectangular box. $[a, b]$ is divided into l subintervals $[x_{i-1}, x_i]$ of equal width Δx , $[c, d]$ is divided into m subintervals $[y_{j-1}, y_j]$ of equal width Δy , $[e, f]$ is divided into n subintervals $[z_{k-1}, z_k]$ of equal width Δz .

1. $B_{ijk} = [x_{i-1}, x_i] \times [y_{j-1}, y_j] \times [z_{k-1}, z_k]$

2. The volume of $B_{ijk} \rightarrow \Delta v = \Delta x \cdot \Delta y \cdot \Delta z$

3. The triple Riemann sum $\sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n f(x_{ijk}^*, y_{ijk}^*, z_{ijk}^*) \Delta v$

4. The triple intergral of f over the box B is

$$\iiint_B f(x, y, z) dv = \lim_{l, m, n \rightarrow 0} \sum_{i=1}^l \sum_{j=1}^m \sum_{k=1}^n f(x_{ijk}^*, y_{ijk}^*, z_{ijk}^*) \Delta v$$

if this limit exists

Theorem(Fubini's Theorem)

If f is continuous on $B = [a, b] \times [c, d] \times [e, f]$

$$\text{then } \iiint_B f(x, y, z)dv = \int_e^f \int_c^d \int_a^b f(x, y, z)dx dy dz$$

Example :

1. Evaluate $\iiint_B xyz^2 dv$, where $B = [0, 1] \times [1, 2] \times [1, 2]$

2. Evaluate $\iiint_B (x + yz)dv$, where $B = [-1, 1] \times [1, 3] \times [0, 2]$

3. $E = \{(x, y, z) \mid 0 \leq x \leq 1, 0 \leq y \leq 2, x \leq z \leq 1 - x - y\}$

How to define $\iiint_E x^2 yz dv = ?$

For a general bounded region E . Consider a rectangular box

$$B \supset E, \text{ and define } F(x, y, z) = \begin{cases} f(x, y, z) & \text{if } (x, y, z) \in E \\ 0 & \text{if } (x, y, z) \notin E \end{cases}$$

$$\text{Define } \iiint_E f(x, y, z)dv = \iiint_B F(x, y, z)dv$$

properties

1. If $E = \{(x, y, z) \mid (x, y) \in D, \phi_1(x, y) \leq z \leq \phi_2(x, y)\}$

$$\text{then } \iiint_E f(x, y, z)dv = \iint_D \left(\int_{\phi_1(x,y)}^{\phi_2(x,y)} f(x, y, z)dz \right) dA$$

2. If $E = \{(x, y, z) \mid a \leq x \leq b, g_1(x) \leq y \leq g_2(x), \phi_1(x, y) \leq z \leq \phi_2(x, y)\}$

$$\text{then } \iiint_E f(x, y, z)dv = \int_a^b \int_{g_1(x)}^{g_2(x)} \int_{\phi_1(x,y)}^{\phi_2(x,y)} f(x, y, z)dzdydx$$

Example :

$$1. E = \{(x, y, z) \mid 0 \leq x \leq 1, 0 \leq y \leq 1 - x, 0 \leq z \leq 1 - x - y\}$$

$$\iiint_E z \, dv = \int_0^1 \int_0^{1-x} \int_0^{1-x-y} z \, dz \, dy \, dx$$

$$2. E = \{(x, y, z) \mid -2 \leq x \leq 2, x^2 \leq y \leq 4, -\sqrt{y-x^2} \leq z \leq \sqrt{y-x^2}\}$$

$$E = \{(x, y, z) \mid -2 \leq x \leq 2, -\sqrt{4-x^2} \leq z \leq \sqrt{4-x^2}, z^2 + x^2 \leq y \leq 4\}$$

$$\iiint_E \sqrt{z^2 + x^2} \, dv = \int_{-2}^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_{z^2+x^2}^4 \sqrt{z^2 + x^2} \, dy \, dz \, dx = \frac{128\pi}{15}$$
